5. SOURCE: Acoustically treated, V. L., no. 3, 1965, 74-76

6. DESCRIPTOR: forced oscillation, nonlinear oscillation, resonant state, stability, stability theory

ABSTRACT: The article deals with finite-amplitude oscillations induced in a round plate under the action of a steady, by an axially-symmetrical periodic force. It is shown that the dominant dynamic is such that the geometrical relations of the plate remain in force, and that the stresses are non-linear functions of the result. Asymptotic solutions of the rigorous equations for the nonlinear forced oscillations, with account of deviations from Hooke's law in the stress-strain curves, are analyzed, resonance curves are plotted, and the conditions of the stability of the oscillations are established. It is shown that the oscillations of amplified round plates of some resonance. Orig. art. has:

SOURCE: Moscow, Universitet, Vestnik, Seriya I, Matematika, mekhanika, no. 5, 1964, 89-98

TOPIC TAGS: particle motion, gravitational field, oscillating surface, Bogoljubov method, Newtonian attraction

ABSTRACT: In the present paper Bogoljubov's method is used to investigate the motion of a particle in the gravitational field of a liquid body whose surface oscillates under the action of the Newtonian attraction between the particles of the liquid. The amplitude of oscillations of the surface of the gravitating body serves as a small parameter of the problem. The coordinates of the particle are found with accuracy permitting the determination of the motion of apical points.

this axis. The presence of a magnetizing field normal to the stable axis changes the value of the coercive force, degrades the shape of the hysteresis loop, and increases the speed of switching. This phenomenon can be exploited by using two orthogonal magnetizing fields for switching, rather than one. This mode of operation is called "coherent" because all elementary vectors rotate in one direction to assume a direction opposite to the initial state. If a single, lower field is used for switching, the rotation occurs in two opposite directions; this is called "noncoherent" state switching. The change of state is very fast (in nanoseconds, or tens of nanoseconds). Logic elements were fabricated from magnetic thin films⁶ (80% Ni, 17% Fe, 3% Co) 1500 Å thick, anisotropic field of 3.4 oersted, and coercive force of 2.4 oersted. Another application of magnetic thin films is in parametrons as a variable inductance of the resonance loop. In a thin film parametron, a displacement field H_0 and an excitation field $H_{ex} = A \cos 2\omega t$ are applied along the axis of anisotropy. Such devices were shown to operate at frequencies as high as 500 MHz. The interaction of adjacent magnetic domains, which reduces the magnetizing force necessary to change the state of an element, if the next element is already in the same state, can be advantageously used to construct shift registers not requiring additional amplification between the stages. An experimental register was made from magnetic thin films (75% Ni, 25% Fe) 900 Å thick and 1 mm wide. In the total area of 3.8 × 2.28 sq cm, 256 binary elements were contained in four magnetic film strips. Orig. art. has: 6 figures.

ABSTRACT: The properties, design, and applications of magnetic thin film structures as storage and logic elements are considered in the light of recent improvements in thin film fabrication techniques and certain advantages inherent in magnetic thin films as compared to more conventional magnetic elements, e. g., cores. The potential ease of manufacturing of large logic systems based on magnetic thin films, low power requirements, and response speed are some of these advantages. The introduction of single axis anisotropy insures stable orientation of the magnetic vector along this axis. If the magnetizing field coincides with the direction of the anisotropy, the hysteresis loop is rectangular. Hence, there are two stable magnetic states along

tape. The memory block is made in the form of a 128 x 128 x 16 matrix of K-260 ferrite cores measuring 2 x 1.3 x 1 mm. To increase the reliability, the matrix, the reading amplifiers, and the magnetic commutator for the address currents are placed in a container where a $(35 \pm 1)^\circ\text{C}$ temperature is maintained. The memory capacity is 128 x 128 16-digit binary numbers. The dead time is 200 microseconds. The circuit contains 300 vacuum tubes and approximately 200 transistors. The operating principle is analyzed and block diagrams of the main units of the memory are presented. Yu. Semenov.

to 87000 at $t = 10$ sec). Excess piperazine due to slow addition increases the probability of the chain breaking. Addition of emulsifiers increases yield and M_w (from 75.8 to 88.0% and from $5.5 \cdot 10^4$ to $9.7 \cdot 10^4$ with $OM=7$ (OP-7)). Chlorinated hydrocarbons as solvents (reaction product partly soluble) produced higher M_w with benzene and toluene (insoluble reaction product): CCl_4 : $M_w = 7.0 \cdot 10^4$, benzene : $M_w = 1.85 \cdot 10^4$. Yield and

M_w also rise with addition of bases, the latter due to fewer chain ruptures with HCl binding and the former probably owing to catalysis of polycondensation. I. M. Bel'govskiy is thanked for assisting in the molecular weights measurements done by the scattered light method. There are 3 figures and 4 tables. TITLE: Interfacial polycondensation of phthalyl chloride and piperazine
PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 7, 1962, 995 - 999

TEXT: Molecular weight and polycondensate yield were studied in dependence on reaction conditions. Owing to the high rate condensation the rate of monomer diffusion and hence the degree of dispersion of the phases play an important part. It is suggested that the molecular weight and yield increase as the reaction approaches the kinetic region. At room temperature and with vigorous stirring a solution of phthalyl chloride in an organic solvent was added to an aqueous solution of piperazine or an emulsion of aqueous solution of piperazine and organic solvent. The volume ratio of the phases was constant at 1 : 1. Table 1 and Figs. 2 and 3 show the dependencies of Mw and yield on various conditions. Molecular weight was higher with more rapid addition (55000 at $t = 10$ min)
